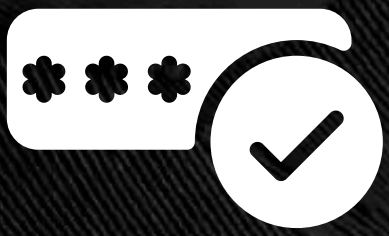
HOW TO CREATE A STRONG PASSWORD



****

1: Make it long

Use at least 12 characters.
Longer passwords are harder for hackers to crack.
Example: Instead of "Password1", try SunflowerField2023!"

2: Add complexity

Mix uppercase, lowercase, numbers, and symbols.
A variety of characters makes guessing more difficult.
Example: Change "ilovepizza" to "iL0vePIzz@Forever!"

3: Keep it unique

Use a different password for every account.
Reusing passwords puts all of your accounts at risk if one is breached.
Solution: Consider a password manager to keep track.

4: Don't share or write it down

Never share your password, even with people you trust.
If it's written down or shared, it could fall into the wrong hands.
Bonus: If you suspect it's been shared, update it immediately.

5: Use Passphrases

Create a memorable phrase instead of a random string.
Passphrases are easier to remember but still secure.
Example: "BlueBananaSky_84" is better than "123456."
